

Science

*Our science topic this half term is
rocks and soils.*

Wednesday 20th January

L.O: To look at the three different
types of rock

There are many different kinds of rock. They are all formed in different ways. Here are some. Do you recognise any?

Sandstone

Granite

Slate

Quartz

There are lots of different types of rock.
We can sort rocks into three main groups:

- Igneous
- Sedimentary
- Metamorphic

 3 types of rock

Vocabulary

- **Igneous** - formed from molten rock from underground that is forced to the surface via a volcano (granite, basalt)
- **Magma** - hot fluid beneath the earth's crust from which lava and igneous rock is formed by cooling.
- **Metamorphic Rock** - sedimentary or igneous rock that has been changed by heat or pressure underground (marble, slate)
- **Metamorphosis** - to change in form, structure or substance. Rock metamorphosis is specifically caused by heat or pressure.
- **Sediment** - loose pieces of minerals and rocks.
- **Sedimentary Rock** - created from sediment layers under the sea (limestone, sandstone, chalk).

Chocolate rocks!

Today you are going to make the three different types of rock out of chocolate. Watch how the teacher does it in the video.

Alternatively, you could use starburst sweets.

YOU WILL NEED

- White, milk and dark chocolate cubes
- Graters
- Cling film squares
- Cups
- A source of hot water

[chocolate rocks lesson](#)

[starburst rocks
\(alternative lesson\)](#)

HOW TO DO IT

- 1) To make **sedimentary rocks**, grate milk, white and dark chocolate into separate piles. Line a cup with cling film and then layer it with the different flavours (sediments). Press them together with your finger and then remove cling film to view your rock.
- 2) To make **metamorphic rocks**, take your sedimentary rock and wrap it in cling film. Shape it into a ball using your hand, massage with your fingers to create heat and watch the rock metamorphosis.

3) **TEACHER DEMONSTRATION:** To make **igneous rocks**, take your sedimentary and metamorphic rocks, wrap in cling film and drop into a source of hot water. Watch as the heat melts the rocks. Take them out and let them cool, turning into igneous rocks.

WHAT ARE WE LEARNING?

When we make sedimentary rock, the pressure from our fingers forces the sediment together into a solid rock. When we make metamorphic rock, the heat and pressure of our hands replicate that of the Earth's crust. When we make igneous rock, the heat (volcano) creates lava (the melting rocks) which eventually cools to create igneous rock.
